168 430 Computer Networks

Chapter 20 Transport Protocols

Connection Oriented Transport Protocol Mechanisms

- Logical connection
- Establishment
- Maintenance termination
- Reliable
- e.g. TCP

Reliable Sequencing Network Service

- Assume arbitrary length message
- Assume virtually 100% reliable delivery by network service
 - $-\mathrm{e.g.}$ reliable packet switched network using X.25
 - $-\mathrm{e.g.}$ frame relay using LAPF control protocol
 - —e.g. IEEE 802.3 using connection oriented LLC service
- Transport service is end to end protocol between two systems on same network

Issues in a Simple Transprot Protocol

- Addressing
- Multiplexing
- Flow Control
- Connection establishment and termination

Addressing

- Target user specified by:
 - User identification
 - Usually host, port
 - Called a socket in TCP
 Port represents a particular transport service (TS) user
 - Transport entity identification
 - Generally only one per host
 - If more than one, then usually one of each type
 - Specify transport protocol (TCP, UDP)
 - Host address
 - An attached network device
 - In an internet, a global internet address
 - Network number

Finding Addresses

- Four methods
 - -Know address ahead of time
 - e.g. collection of network device stats
 - -Well known addresses
 - -Name server
 - -Sending process request to well known address

Multiplexing

- Multiple users employ same transport protocol
- User identified by port number or service access point (SAP)
- May also multiplex with respect to network services used
 - -e.g. multiplexing a single virtual X.25 circuit to a number of transport service user
 - X.25 charges per virtual circuit connection time

Flow Control

- Longer transmission delay between transport entities compared with actual transmission time -Delay in communication of flow control info
- Variable transmission delay -Difficult to use timeouts
- Flow may be controlled because: -The receiving user can not keep up -The receiving transport entity can not keep up
- · Results in buffer filling up

Coping with Flow Control Requirements (1)

- Do nothing
 - -Segments that overflow are discarded
 - -Sending transport entity will fail to get ACK and will retransmit · Thus further adding to incoming data
- · Refuse further segments

 - -Clumsv
 - -Multiplexed connections are controlled on aggregate flow

Coping with Flow Control Requirements (2)

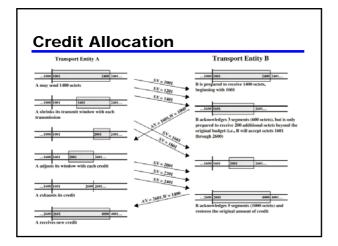

- · Use fixed sliding window protocol
 - -See chapter 7 for operational details
 - -Works well on reliable network
 - · Failure to receive ACK is taken as flow control indication -Does not work well on unreliable network
 - · Can not distinguish between lost segment and flow control
- · Use credit scheme

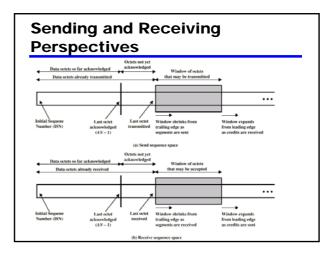

Credit Scheme

- Greater control on reliable network
- More effective on unreliable network
- · Decouples flow control from ACK -May ACK without granting credit and vice versa
- Each octet has sequence number
- Each transport segment has seq number, ack number and window size in header

Use of Header Fields

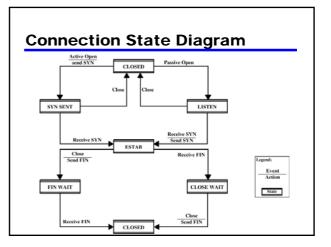

- When sending, seq number is that of first octet in segment
- ACK includes AN=i, W=j
- All octets through SN=i-1 acknowledged -Next expected octet is i
- Permission to send additional window of W=j octets
 - -i.e. octets through i+j-1

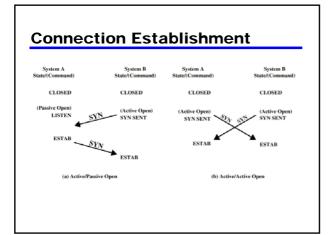

Establishment and Termination

- Allow each end to now the other exists
- Negotiation of optional parameters
- Triggers allocation of transport entity resources
- By mutual agreement

Not Listening

- Reject with RST (Reset)
- Queue request until matching open issued
- Signal TS user to notify of pending request —May replace passive open with accept

Termination

- · Either or both sides
- By mutual agreement
- Abrupt termination
- Or graceful termination
 - -Close wait state must accept incoming data until FIN received

Side Initiating Termination

- TS user Close request
- Transport entity sends FIN, requesting termination
- Connection placed in FIN WAIT state
 —Continue to accept data and deliver data to user
 —Not send any more data
- When FIN received, inform user and close connection

Side Not Initiating Termination

- FIN received
- Inform TS user Place connection in CLOSE WAIT state
 Continue to accept data from TS user and transmit it
- TS user issues CLOSE primitive
- Transport entity sends FIN
- Connection closed
- · All outstanding data is transmitted from both sides
- · Both sides agree to terminate

Unreliable Network Service

- E.g.
 - -internet using IP,
 - -frame relay using LAPF
 - -IEEE 802.3 using unacknowledged connectionless LLC
- · Segments may get lost
- · Segments may arrive out of order

Problems

- Ordered Delivery
- Retransmission strategy
- · Duplication detection
- Flow control
- Connection establishment
- Connection termination
- Crash recovery

Ordered Delivery

- Segments may arrive out of order
- · Number segments sequentially
- TCP numbers each octet sequentially
- Segments are numbered by the first octet number in the segment

Retransmission Strategy

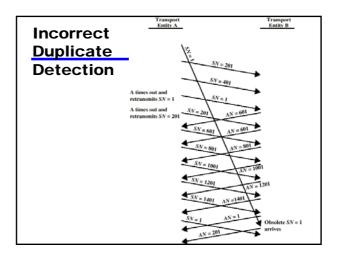

- Segment damaged in transit
- · Segment fails to arrive
- Transmitter does not know of failure
- · Receiver must acknowledge successful receipt
- · Use cumulative acknowledgement
- Time out waiting for ACK triggers re-transmission

Timer Value

- · Fixed timer
 - -Based on understanding of network behavior
 - -Can not adapt to changing network conditions
 - ${\rm Too}\ {\rm small}\ {\rm leads}\ {\rm to}\ {\rm unnecessary}\ {\rm re-transmissions}$
 - -Too large and response to lost segments is slow
 - -Should be a bit longer than round trip time
- Adaptive scheme
 - -May not ACK immediately
 - -Can not distinguish between ACK of original segment
 - and re-transmitted segment —Conditions may change suddenly

Duplication Detection

- If ACK lost, segment is re-transmitted
- · Receiver must recognize duplicates
- Duplicate received prior to closing connection —Receiver assumes ACK lost and ACKs duplicate
 - -Sender must not get confused with multiple ACKs
 - -Sequence number space large enough to not cycle within maximum life of segment
- Duplicate received after closing connection

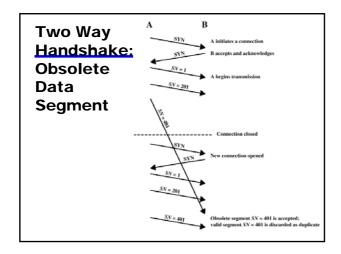

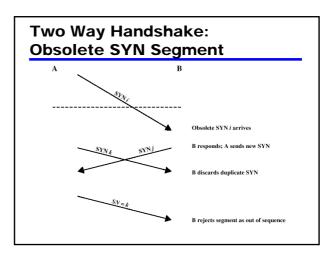

Flow Control

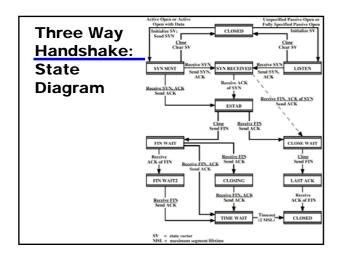

- Credit allocation
- Problem if AN=i, W=0 closing window
- Send AN=i, W=j to reopen, but this is lost
- Sender thinks window is closed, receiver thinks it is open
- Use window timer
- If timer expires, send something —Could be re-transmission of previous segment

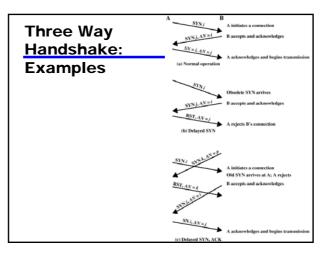

Connection Establishment

- Two way handshake
 - A send SYN, B replies with SYN
 - Lost SYN handled by re-transmission
 - Can lead to duplicate SYNs
 - Ignore duplicate SYNs once connected
- Lost or delayed data segments can cause connection problems
 - Segment from old connections
 - Start segment numbers fare removed from previous connection
 Use SYN i
 - Need ACK to include i
 - Three Way Handshake

Connection Termination

- Entity in CLOSE WAIT state sends last data segment, followed by FIN
- FIN arrives before last data segment
- Receiver accepts FIN
 - Closes connection
 - Loses last data segment
- Associate sequence number with FIN
- Receiver waits for all segments before FIN sequence number
- Loss of segments and obsolete segments
 Must explicitly ACK FIN

Graceful Close

- Send FIN i and receive AN i
- Receive FIN j and send AN j
- Wait twice maximum expected segment lifetime

Failure Recovery

- After restart all state info is lost
- Connection is half open -Side that did not crash still thinks it is connected
- · Close connection using persistence timer -Wait for ACK for (time out) * (number of retries) -When expired, close connection and inform user
- · Send RST i in response to any i segment arriving
- · User must decide whether to reconnect -Problems with lost or duplicate data

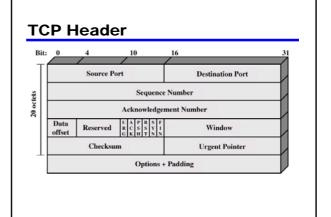

TCP & UDP

- Transmission Control Protocol -Connection oriented -RFC 793
- User Datagram Protocol (UDP) -Connectionless -RFC 768

TCP Services

- · Reliable communication between pairs of processes
- · Across variety of reliable and unreliable networks and internets
- Two labeling facilities
- Data stream push
 - TCP user can require transmission of all data up to push flag
 - Receiver will deliver in same manner · Avoids waiting for full buffers
- -Urgent data signal

 - Indicates urgent data is upcoming in stream · User decides how to handle it

Items Passed to IP

- TCP passes some parameters down to IP -Precedence
 - -Normal delay/low delay
 - -Normal throughput/high throughput
 - -Normal reliability/high reliability

-Security

TCP Mechanisms (1)

- · Connection establishment -Three way handshake
 - -Between pairs of ports
 - -One port can connect to multiple destinations

TCP Mechanisms (2)

- Data transfer
 - -Logical stream of octets
 - -Octets numbered modulo 223
 - $-\ensuremath{\mathsf{Flow}}$ control by credit allocation of number of octets
 - -Data buffered at transmitter and receiver

TCP Mechanisms (3)

- Connection termination
 - -Graceful close
 - -TCP users issues CLOSE primitive
 - -Transport entity sets FIN flag on last segment sent
 - Abrupt termination by ABORT primitive
 Entity abandons all attempts to send or receive data
 - RST segment transmitted

Implementation Policy Options

- Send
- Deliver
- Accept
- Retransmit
- Acknowledge

Send

- If no push or close TCP entity transmits at its own convenience
- Data buffered at transmit buffer
- May construct segment per data batch
- May wait for certain amount of data

Deliver

- In absence of push, deliver data at own convenience
- May deliver as each in order segment received
- May buffer data from more than one segment

Accept

- · Segments may arrive out of order
- In order
 - -Only accept segments in order
 - —Discard out of order segments
- In windows
 - -Accept all segments within receive window

Retransmit

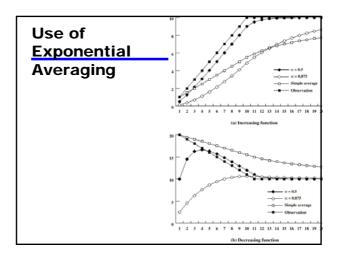

- TCP maintains queue of segments transmitted but not acknowledged
- TCP will retransmit if not ACKed in given time —First only
 - -Batch
 - -Individual

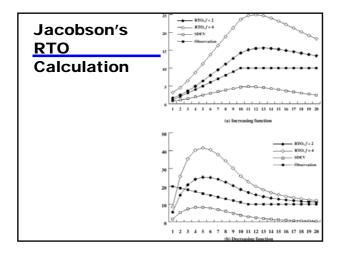

Acknowledgement

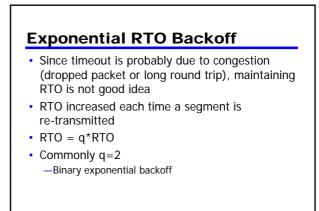

- Immediate
- Cumulative

Congestion Control

- RFC 1122, Requirements for Internet hosts
- Retransmission timer management
 - -Estimate round trip delay by observing pattern of delay
 - -Set time to value somewhat greater than estimate
 - -Simple average
 - -Exponential average
 - -RTT Variance Estimation (Jacobson's algorithm)

Karn's Algorithm

- If a segment is re-transmitted, the ACK arriving may be:
 - -For the first copy of the segment
 - RTT longer than expected -For second copy
- · No way to tell
- · Do not measure RTT for re-transmitted segments
- Calculate backoff when re-transmission occurs
- · Use backoff RTO until ACK arrives for segment that has not been re-transmitted

Window Management

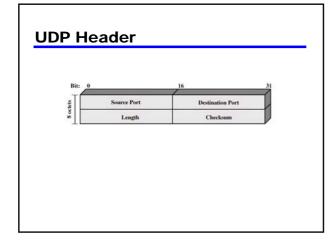

- · Slow start
 - awnd = MIN[credit, cwnd]
 - Start connection with cwnd=1
 - Increment cwnd at each ACK, to some max
- Dynamic windows sizing on congestion - When a timeout occurs
 - Set slow start threshold to half current congestion window ssthresh=cwnd/2
 - Set cwnd = 1 and slow start until cwnd=ssthresh
 - Increasing cwnd by 1 for every ACK - For cwnd >=ssthresh, increase cwnd by 1 for each RTT

UDP

- User datagram protocol
- RFC 768
- Connectionless service for application level procedures -Unreliable
 - -Delivery and duplication control not guaranteed
- · Reduced overhead
- e.g. network management (Chapter 19)

UDP Uses

- Inward data collection
- · Outward data dissemination
- Request-Response
- · Real time application
