Shift Register

- data is often stored in *registers*, rather than individual flip-flops.
- A register is just a collection of flip-flops, often with a common name (using subscripts to indicate the individual flip-flops) and usually with a common clock.
- A *shift register* is a set of flip-flops, such that the data moves one place to the right on each clock or shift input.

- Serial-in / Parallel-in Shift Registers
- Serial-out / Parallel-out Shift Registers
- Right / Left Shift Registers
- Leading-edge / Trailing-edge Shift Registers
- *Enable, Clear, Load pins*

Programmable Logic Devices (PLD)

- Since sequential system is a combination of memory and combinational logic, it can be implemented using any of the programmable logic devices of Chapter 4 (for the combinational logic) and some flip-flops (for the memory).
- There are a variety of devices commercially available that combine primarily a PAL and some D flip-flops. There are also some very complex programmable devices available.

Design using ASM diagrams

- ASM (algorithmic state machine) is the same as sequential system.
- A tool is cross between a state diagram and a flow chart is the ASM diagram.
